内容概要

Cybersecurity is an enormous problem for our country because many of our nation's critical assets are vulnerable to cyberattack. Computers control major systems such as the air traffic control system and the electrical power grid. Foreign nations can cripple these systems by attacking the computers that control them. A cyberattack on these systems by teams of computer scientists, employed by enemy nations or terrorist groups, could disrupt and devastate modern society. This book explores the nature of our nation's cybersecurity problem and the solutions we have to deal with it.
