## &lt;&lt;牙周病学&gt;&gt;

## 内容概要

This classic and well-respected book has been entirely updated, from the latest information, to a colorful new design and extensive color illustrations. Previously published as Outline of Periodontics, this edition has grown into a more comprehensive, heavily referenced, authoritative text. It examines disease of the tissues surrounding and supporting the teeth, and it helps general dental practitioners prevent tooth loss in their patients through establishing a treatment plan that emphasizes periodontal health. One of the most respected UK textbooks on periodontology. Comprehensive material covers both the scientific background of periodontics, as well as the treatment of patients. An acclaimed chapter on periodontal considerations in restorative dentistry highlights this important topic. The appearance of the book has been entirely reworked to include color photos throughout, color highlights to line diagrams, and shaded tables to enhance the clarity of material. New and updated information is provided on plaque, genetic and stress factors, and the immune system. A new section examines periodontal disease as a risk factor for systemic disease. Information on the chemotherapeutic approach has been divided among three new chapters on Antiseptics, Antibiotics, and Antibiotic Prophylaxis.

## 书籍目录

Preface  
Dedication  
1 The periodontal tissues  
2 The oral environment in health and disease  
3 Host-parasite interaction  
4 The aetiology of periodontal disease  
5 Mechanisms of disease production  
6 The effect of systemic factors on the periodontal tissues  
7 Acquired immunodeficiency syndrome (AIDS)  
8 The natural history of periodontal disease  
9 Classification of periodontal diseases  
10 Epidemiology of periodontal disease - the size of the problem  
11 Prevention of periodontal disease  
12 Clinical features of chronic periodontal disease  
13 Diagnosis, prognosis and treatment plan  
14 Diagnostic tests of periodontal disease activity  
15 Basic treatment of chronic gingivitis and periodontitis  
16 The use of antiseptics, enzymes and oxygenating agents as adjuncts in supragingival plaque control  
17 The possible use of antibiotics as adjuncts in the treatment of chronic periodontitis  
18 Antibiotic prophylaxis for susceptible patients undergoing periodontal treatment  
19 Surgical periodontal treatment  
20 Management of bone defects and furcation involvement  
21 Mucogingival problems and their treatment  
22 The periodontal abscess  
23 Early-onset periodontitis: juvenile periodontitis/aggressive periodontitis  
24 Acute and infectious lesions of the gingiva  
25 Acute necrotizing ulcerative gingivitis  
26 Epulides and tumours of the gingivae and oral mucosa  
27 Occlusion  
28 Splinting  
29 Dental implants and peri-implantology  
30 The relationship between periodontal and restorative treatment  
Index
