<<中国土壤系统分类>>

内容概要

《中国土壤系统分类:修订方案(英文版)》主要内容：The rise and fall of civilizations have been closely linked with the use and abuse of soil and water resources. There is little reason to believe that these linkages will disappear in the future. People need soils, and soils need people. Soil classification is a technique to systematically organize data, information, knowledge and speculation about soils. In the natural world, soils are understood as the products of soil forming processes that are influenced throughout time by the soil forming factors of parent material, biota, climate, and topography. In the world of human-induced changes of factors and processes, soils are understood as complex entities whose multiple functions are essential for a sustainable global habitat that provides a reasonable quality of life for all things.
