

<<量子力学>>

图书基本信息

书名：<<量子力学>>

13位ISBN编号：9787030333599

10位ISBN编号：7030333594

出版时间：2012-2

出版时间：科学出版社

作者：林多梁 著

页数：272

版权说明：本站所提供下载的PDF图书仅提供预览和简介，请支持正版图书。

<<量子力学>>

内容概要

本书是在作者长期的科学研究和多年执教中，吸取美国大学教学特点，结合中国高校教学改革的具体情况编著的。

内容适合读者由浅入深的学习，对量子力学的抽象理论，通过理论阐述和具体事例对照，更易于理解和掌握。

讲授基本知识的同时，本书也介绍了科学研究的前沿知识，使读者深入了解目前量子力学理论的发展状况。

本书适合物理专业本科生及研究生学习使用，也可做为科研人员参考使用。

<<量子力学>>

书籍目录

Preface

.Brief review of historical development

- 1.Black body radiation
- 2.Photoelectric effect
- 3.Specific heat of solids
- 4.Compton effect

Problems

.Uncertainty and complementarity

- 1.Einstein relations and Bohr complementarity principle
- 2.Wave-particle duality and quantum behavior
- 3.De Broglie relation and Heisenberg uncertainty relation
- 4.Further remarks on the uncertainty principle

Problems

.The Schrödinger wave equation

- 1.Postulates of quantum mechanics
- 2.The Schrödinger equation for free particles
- 3.Probability distributions
- 4.Operators and expectation values
- 5.Motion of a free wave packet
- 6.Schrödinger equation for a particle in external fields
- 7.Schrödinger equation for a system of interacting particles

Problems

.Heisenberg equation of motion and commutators

- 1.Heisenberg equation of motion
- 2.Commutation relations

Problems

.Symmetry properties and conservation laws

- 1.Uniformity of time
- 2.Uniformity of space
- 3.Isotropy of space
- 4.Discrete transformation
- 5.Reduction of the two-body problem

Problems

.Eigenfunctions and eigenvalues

- 1.Stationary states
- 2.Spectrum of the Hamiltonian
- 3.Dirac's δ -function
- 4.Orthonormality and completeness
- 5.Density of states
- 6.Linear vector space
- 7.Simultaneous eigenfunctions and compatible observables
- 8.Probability amplitudes

Problems

.The classical limit and WKB method

- 1.Ehrenfest theorem

<<量子力学>>

2. Classical limit of Schrödinger equation

3. The semi-classical approximation for stationary states

4. The quantization rule of Bohr and Sommerfeld

Problems

. Illustrative examples in one dimension

1. Square well potential

2. Scattering from the square well-resonances and virtual states

3. Periodic potential-Kronig-Penney model

4. The 3 function potential

5. Linear harmonic oscillator

Problems

. Illustrative examples in three dimensional space

1. The wave equation in spherical coordinates

2. Symmetry properties of the central field problem

3. Angular momentum eigenstates

4. Free particle motion with a definite

5. Isotropic square well

6. Hydrogen atom ;

7. Degeneracy of hydrogen energy levels

8. Electron in magnetic fields--a cylindrical field problem

9. Examples in the confined and low-dimension space

Problems

. Angular momentum

1. Matrix representation of angular momentum operators

2. Spin eigenvectors

* 3. Coupling of two angular momentum vectors

4; Rotation matrices

5. Arbitrary rotation of a rigid body

Problems

. Unitary transformation

1. States and operators

2. Unitary operators and unitary transformations

3. Observables in different representations

* 4., Schrödinger, Heisenberg and interaction pictures

* 5. The interaction picture

6. Pure and, mixed states

Problems

. Approximation methods

1. Variation method

2. Perturbation theory for nondegenerate stationary states

3. Validity of the perturbation method

4. Perturbation theory for degenerate states

5. Fine structure of hydrogen atomic spectra

6. Atoms in external magnetic fields

Problems

. Many-electron systems

<<量子力学>>

1. Indistinguishability and Pauli principle
2. Symmetrization and anti-symmetrization of wave functions
3. Ground state of helium atom
4. Excited states of helium atom
5. Slater determinant for many-electron atoms
6. Hartree-Fock method
7. Statistical model of Fermi-Thomas
- Problems
 - . Theory of time-dependent perturbation
 1. Time-dependent perturbation
 2. Transition probability per unit time
 3. Adiabatic and sudden approximation
 4. Induced emission, absorption and spontaneous emission
 5. Multipole radiation and selection rules
 6. Lifetime and width of excited levels
 7. Photoelectric effect
 8. Magnetic resonance
 9. Oscillating strength Problems
 - . Theory of scattering
 1. General theory of elastic scattering
 2. Green function for a free particle
 3. The Born approximation
 4. Validity criteria for the Born approximation
 5. Method of partial waves
 6. Eikonal approximation
 7. Elastic scattering from the Coulomb potential
 8. General theory of inelastic scattering--The Eipman-Schwinger formulation
 9. Scattering from complex targets
- Problems
- References
- Index

<<量子力学>>

编辑推荐

量子力学 (Quantum Mechanics)是研究微观粒子的运动规律的物理学分支学科,它主要研究原子、分子、凝聚态物质,以及原子核和基本粒子的结构、性质的基础理论,它与相对论一起构成了现代物理学的理论基础。

量子力学不仅是近代物理学的基础理论之一,而且在化学等有关学科和许多近代技术中也得到了广泛的应用。

《Quantum Mechanics》(作者Lin Duoliang、Liang Junjun)是本介绍量子力学的英文专著。
