作者简介

休 D.杨 (Hugh D.Young) is Emeritus Professor of Physics at Carnegie Mellon University in Pittsburgh , PA.He attended Carnegie Mellon for both undergraduate and graduate study and earned his Ph.D.in fundamental particle theory under the direction of the late Richard Cutkosky.He joined the faculty of Carnegie Mellon in 1956 and has also spent two years as a Visiting Professor at the University of California at Berkeley. Prof Young ' S career has centered entirely around undergraduate education.He has written several undergraduate-level textbooks , and in 1973 he became a co-author with Francis Sears and Mark Zemansky for their well-known introductory texts. With their deaths , he assumed full responsibility for new editions of these books until joined by Prof.Freedman for University Physics. Prof.Young is an enthusiastic skier, climber, and hiker. He also served for several years as Associate Organist at St.Paul ' S Cathedral in Pittsburgh , and has played numerous organ recitals in the Pittsburgh area.Prof.Young and his wife Alice usually travel extensively in the summer, especially in Europe and in the desert canyon country of southern Utah.

章节摘录

插图：The development of physical theory requires creativity at every stage. The physicist has to learn to ask appropriate questions, design experiments to try to answer the questions, and draw appropriate conclusions from the results. Figure 1 shows two famous experimental facilities. Legend has it that Galileo Galilei (1564-1642) dropped light and heavy objects from the top of the Leaning Tower of Pisa (Fig. 1.1a) to find out whether their rates of fall were the same or different. Galileo recognized that only experimental investigation could answer this question. From examining the results of his experiments (which were actually much more sophisticated than in the legend), he made the inductive leap to the principle, or theory, that the acceleration of a falling body is independent of its weight. The development of physical theories such as Galileo's is always a two-way process that starts and ends with observations or experiments. This development often takes an indirect path, with blind alleys, wrong guesses, and the discarding of unsuccessful theories in favor of more promising ones. Physics is not simply a collection of facts and principles; it is also the process by which we arrive at general principles that describe how the physical universe behaves. No theory is ever regarded as the final or ultimate truth. The possibility always exists that new observations will require that a theory be revised or discarded. It is in the nature of physical theory that we can disprove a theory by finding behavior that is inconsistent with it, but we can never prove that a theory is always correct. Getting back to Galileo, suppose we drop a feather and a cannonball. They certainly do not fall at the same rate. This does not mean that Galileo was wrong; it means that his theory was incomplete. If we drop the feather and the cannonball in a vacuum to eliminate the effects of the air, then they do fall at the same rate. Galileo's theory has a range of validity: It applies only to objects for which the force exerted by the air (due to air resistance and buoyancy) is much less than the weight. Objects like feathers or parachutes are clearly outside this range. Every physical theory has a range of validity outside of which it is not applicable. Often a new development in physics extends a principle's range of validity. Galileo's analysis of falling bodies was greatly extended half a century later by Newton's laws of motion and law of gravitation.
