章节摘录

I. Firmly and unshakably develop the undertaking of the traditional Chinese health science and medicines. In recent years, the undertaking of traditional Chinese health science and medicines has developed tremendously but, at the same time, also encountered several difficulties and problems. Different views exist in both the interior of the trade and the society. To sum up, they are the problems about how to regard the undertaking of it and how to work for it. I think we should look upon the development of traditional Chinese health science and medicines with a much wider field of vision and at a much deeper hierarchy. Firstly, the position and function of it as well as its scientific nature cannot be tolerated to raise any query. The health science created by it for the Chinese nationalities is the treasure in the excellent national culture. For thousands of years, it lives and breeds in an endless succession and extends continuously and uninterruptedly, revealing itself a powerful vitality. Till now, it still brings its role into full play in the respect of safeguarding the health of the masses of the people so that it is an indispensable important component part in the health service system of our country. The historical position, actual role and scientific value of it exist objectively~which has been tested in practice for a long period of time and has a wide and solid foundation in masses and society. Therefore, it must be developed energetically, viewing from either the health angle or the cultural angle. Secondly, the traditional Chinese health science and medicines has a tremendous market demand. Ours is a country in development and a poor country that runs a big health service. We must build up basic hygienic protection health system step by step. In order to solve the problem of "difficult in accessibility and costly in affordability" for seeking health service, we must fully develop and utilize the resources of traditional Chinese health science and medicines and give full play to the role of it. With the elevation of the living level of masses of the people, the enlargement of the aged human group and the change in the idea of health, people again have a new understanding of the Chinese traditional health science and medicines. Thus, multilevel and multiform demand for traditional Chinese health science and medicines tends to be increased. As a result, traditional Chinese health science and medicines can then have obtained a much broader space for development. Thirdly, the traditional Chinese health science and medicines is the most to have the original potential for innovation. The overwhelming majority of theories, technique and recipes of it are the original creations of our country and the important resources of the innovation of our own.
