2009Appendix2 China Financial Market Statistics

章节摘录

插图：In 2009, affected by the enormous shock from the international financial crisis, China's economic development experienced severe difficulties. Confronted with extremely complicated and grave situations at home and abroad, China stuck to a proactive fiscal policy and a moderately loose monetary policy, fully carrying out and constantly improving the package of plans for addressing the international financial crisis. As a result, China's economy was the first in the world to make an overall turnaround. In the face of the crisis, China's financial markets not only provided strong backing to national economic construction, but also maintained rapid and sound growth momentum. Funds raised increased significantly, trading volume hit historic high, market structure was further optimized, and functions such as investing and financing, price discovery and risk hedging were all enhanced.

1. Macro Environment for China's Financial Market Development In 2009, in response to the ripple effect of the international financial crisis triggered by the U.S. subprime meltdown, major economies of the world continued to roll out bailout measures such as benchmark rate cuts and liquidity provision. As the policies started to pay off in the second half of the year, the global economy entered a slow, zigzag recovery. Due to a rebound in fundamentals and the loose macroeconomic policies adopted by major economies, asset prices and commodity prices around the world rose dramatically after the steep fall last year. Moreover, major financial market rates dropped and credit market conditions improved markedly. China's economy was the first in the world to stabilize and see an upturn. Its economic structure was further optimized, its macro financial environment was moderately loose and its financial system witnessed stable and sound growth.
