

<<泛函分析>>

图书基本信息

书名：<<泛函分析>>

13位ISBN编号：9787506226110

10位ISBN编号：7506226111

出版时间：1999-6

出版时间：世界图书出版公司

作者：K.Yosida著

页数：500

版权说明：本站所提供下载的PDF图书仅提供预览和简介，请支持正版图书。

<<泛函分析>>

内容概要

The present book is based on lectures given by the author at the University of Tokyo during the past ten years. It is intended as a textbook to be studied by students on their own or to be used in a course on Functional Analysis, i.e., the general theory of linear operators in function spaces together with salient features of its application to diverse fields of modern and classical analysis. Necessary prerequisites for the reading of this book are summarized, with or without proof, in Chapter 0 under titles: Set Theory, Topological Spaces, Measure Spaces and Linear Spaces. Then, starting with the chapter on Semi-norms, a general theory of Banach and Hilbert spaces is presented in connection with the theory of generalized functions of S. L. SOBOLEV and L. SCHWARTZ. While the book is primarily addressed to graduate students, it is hoped it might prove useful to research mathematicians, both pure and applied. The reader may pass, e.g., from Chapter IX (Analytical Theory of Semi-groups) directly to Chapter XIII (Ergodic Theory and Diffusion Theory) and to Chapter XIV (Integration of the Equation of Evolution). Such materials as "Weak Topologies and Duality in Locally Convex Spaces" and "Nuclear Spaces" are presented in the form of the appendices to Chapter V and Chapter X, respectively. These might be skipped for the first reading by those who are interested rather in the application of linear operators.

书籍目录

Contents 0. Preliminaries 1. Set Theory 2. Topological Spaces 3. Measure Spaces 4. Linear Spaces I. Semi-norms 1. Semi-norms and Locally Convex Linear Topological Spaces 2. Norms and Quasi-norms 3. Examples of Normed Linear Spaces 4. Examples of Quasi-normed Linear Spaces 5. Pre-Hilbert Spaces 6. Continuity of Linear Operators 7. Bounded Sets and Borel Spaces 8. Generalized Functions and Generalized Derivatives 9. B-spaces and F-spaces 10. The Completion 11. Factor Spaces of a B-space 12. The Partition of Unity 13. Generalized Functions with Compact Support 14. The Direct Product of Generalized Functions II. Applications of the Baire-Hausdorff Theorem 1. The Uniform Boundedness Theorem and the Resonance Theorem 2. The Vitali-Hahn-Saks Theorem 3. The Termwise Differentiability of a Sequence of Generalized Functions 4. The Principle of the Condensation of Singularities 5. The Open Mapping Theorem 6. The Closed Graph Theorem 7. An Application of the Closed Graph Theorem (Hormander's Theorem) III. The Orthogonal Projection and F. Riesz Representation Theorem 1. The Orthogonal Projection 2. "Nearly Orthogonal" Elements IV. The Hahn-Banach Theorems V. Strong Convergence and Weak Convergence VI. Fourier Transform and Differential Equations VII. Dual Operators VIII. Resolvent and Spectrum IX. Analytical Theory of Semi-groups X. Compact Operators XI. Normed Rings and Spectral Representation XII. Other Representation Theorems in Linear Spaces XII. Ergodic Theory and Diffusion Theory XIV. The Integration of the Equation of Evolution Supplementary Notes Bibliography Index Notation of Spaces
