

<<金融建模中的鞅方法>>

图书基本信息

书名：<<金融建模中的鞅方法>>

13位ISBN编号：9787506283076

10位ISBN编号：7506283077

出版时间：2007-5

出版时间：北京世图

作者：姆斯拉

页数：636

版权说明：本站所提供下载的PDF图书仅提供预览和简介，请支持正版图书。

<<金融建模中的鞅方法>>

内容概要

The origin of this book can be traced to courses on financial mathematics taught by us at the University of New South Wales in Sydney , Technical University of Warsaw ( Politechnika Watszawska ) and Institut National Polytechnique de Grenoble. Our initial aim was to write a short text around the material used in two one-semester graduate courses attended by students with diverse disciplinary backgrounds ( mathematics , physics , computer science , engineering , economics and commerce ) . The anticipated diversity of potential readers explains the somewhat unusual way in which the book is written. It starts at a very elementary mathematical level and does not assume any prior knowledge of financial markets. Later , it develops into a text which requires some familiarity with concepts of stochastic calculus ( the basic relevant notions and results are collected in the appendix ) . Over time , what was meant to be a short text acquired a life of its own and started to grow. The final version can be used as a textbook for three one-semester courses one at undergraduate level , the other two as graduate courses.

书籍目录

Preface of the First Edition  
 Preface of the Second Edition  
 Part I. Spot to the Futures Markets  
 1. An Introduction to Financial Derivatives  
 1.1 Options  
 1.2 Futures Contracts and Options  
 1.3 Forward Contracts  
 1.4 Call and Put Spot Options  
 1.4.1 One-period Spot Market  
 1.4.2 Replicating Portfolios  
 1.4.3 Martingale Measure for a Spot Market  
 1.4.4 Absence of Arbitrage  
 1.4.5 Optimality of Replication  
 1.4.6 Put Option  
 1.5 Futures Call and Put Options  
 1.5.1 Futures Contracts and Futures Prices  
 1.5.2 One-period Futures Market  
 1.5.3 Martingale Measure for a Futures Market  
 1.5.4 Absence of Arbitrage  
 1.5.5 One-period Spot/Futures Market  
 1.6 Forward Contracts  
 1.6.1 Forward Price  
 1.7 Options of American Style  
 2. The Cox-Ross-Rubinstein Model  
 2.1 The CRR Model of a Stock Price  
 2.1.1 The CRR Option Pricing Formula  
 2.1.2 The Black-Scholes Option Pricing Formula  
 2.2 Probabilistic Approach  
 2.2.1 Martingale Measure  
 2.2.2 Risk-neutral Valuation Formula  
 2.3 The Black-Scholes Option Pricing Formula  
 2.4 Valuation of American Options  
 2.4.1 American Call  
 2.4.2 American Put  
 2.4.3 American Claim  
 2.5 Options on a Dividend-paying Stock  
 2.6 Finite Spot Markets  
 2.6.1 Self-financing Trading Strategies  
 2.6.2 Arbitrage Opportunities  
 2.6.3 Arbitrage Price  
 2.6.4 Risk-neutral Valuation Formula  
 2.6.5 Price Systems  
 2.6.6 Completeness of a Finite Market  
 2.6.7 Change of a Numeraire  
 2.7 Finite Futures Markets  
 2.7.1 Self-financing Futures Strategies  
 2.7.2 Martingale Measures for a Futures Market  
 2.7.3 Risk-neutral Valuation Formula  
 2.8 Futures Prices Versus Forward Prices  
 2.9 Discrete-time Models with Infinite State Space  
 3. Benchmark Models in Continuous Time  
 3.1 The Black-Scholes Model  
 3.1.1 Risk-free Bond  
 3.1.2 Stock Price  
 3.1.3 Self-financing Trading Strategies  
 3.1.4 Martingale Measure for the Spot Market  
 3.1.5 Black-Scholes Option Pricing Formula  
 3.1.6 Case of Time-dependent Coefficients  
 3.1.8 Put-Call Parity for Spot Options  
 3.1.9 Black-Scholes PDE : 3.1.10 A Riskless Portfolio Method  
 3.1.11 Black-Scholes Sensitivities  
 3.1.12 Market Imperfections  
 3.1.13 Numerical Methods  
 3.2 A Dividend-paying Stock  
 3.2.1 Case of a Constant Dividend Yield  
 3.2.2 Case of Known Dividends  
 3.3 Bachelier Model  
 3.3.1 Bachelier Option Pricing Formula  
 3.3.2 Bachelier's PDE.....  
 Part II. Fixed-income Markets  
 Part  
 APPENDICES  
 References  
 Index

## 章节摘录

We shall now describe, following Hull (1997), the basic features of traditional stock and options markets, as opposed to computerized online trading. The most common system for trading stocks is a specialist system. Under this system, an individual known as the specialist is responsible for being a market maker and for keeping a record of limit orders - that is, orders that can only be executed at the specified price or a more favorable price. Options usually trade under a market maker system. A market maker for a given option is an individual who will quote both a bid and an ask price on the option whenever he is asked to do so. The bid price is the price at which the market maker is prepared to buy and the ask price is the price at which he is prepared to sell. At the time the bid and ask prices are quoted, the market maker does not know whether the trader who asked for the quote wants to buy or sell the option. The amount by which the ask exceeds the bid is referred to as the bid-ask spread. To enhance the efficiency of trading, the exchange may set upper limits for the bid-ask spread. The existence of the market maker ensures that buy and sell orders can always be executed at some price without delay. The market makers themselves make their profits from the bid-ask spread. When an investor writes options, he is required to maintain funds in a margin account. The size of the margin depends on the circumstances, e.g., whether the option is covered or naked - that is, whether the option writer does possess the underlying shares or not. Let us finally mention that one contract gives the holder the right to buy or sell 100 shares; this is convenient since the shares themselves are usually traded in lots of 100. ....
