

<<数理逻辑>>

图书基本信息

书名：<<数理逻辑>>

13位ISBN编号：9787506292276

10位ISBN编号：7506292270

出版时间：2008-5

出版时间：世界图书出版公司

作者：艾宾浩斯 (Ebbinghaus H.D.),J. Flum,W. Thomas

页数：289

内容概要

What is a mathematical proof? How can proofs be justified? Are there limitations to provability? To what extent can machines carry out mathematical proofs? Only in this century has there been success in obtaining substantial and satisfactory answers. The present book contains a systematic discussion of these results. The investigations are centered around first-order logic. Our first goal is Godels completeness theorem , which shows that the consequence relation coincides with formal provability : By means of a calculus consisting of simple formal inference rules , one can obtain all consequences of a given axiom system (and in particular , imitate all mathematical proofs)

《数理逻辑(第2版)》由世界图书出版公司出版。

A short digression into model theory will help us to analyze the expressive power of the first-order language , and it will turn out that there are certain deficiencies. For example , the first-order language does not allow the formulation of an adequate axiom system for arithmetic or analysis. On the other hand , this difficulty can be overcome—even in the framework of first-order logic——by developing mathematics in set-theoretic terms. We explain the prerequisites from set theory necessary for this purpose and then treat the subtle relation between logic and set theory in a thorough manner. Godel ' s incompleteness theorems are presented in connection with several related results (such as Trahtenbrot ' s theorem) which all exemplify the limitations of machine-oriented proof methods. The notions of computability theory that are relevant to this discussion are given in detail.
