

<<量子场物理学>>

图书基本信息

书名：<<量子场物理学>>

13位ISBN编号：9787506292764

10位ISBN编号：7506292769

出版时间：2010-4

出版时间：世界图书出版公司

作者：斯通

页数：270

版权说明：本站所提供下载的PDF图书仅提供预览和简介，请支持正版图书。

前言

This book is intended to provide a general introduction to the physics of quantized fields and many-body physics. It is based on a two-semester sequence of courses taught at the University of Illinois at Urbana-Champaign at various times between 1985 and 1997. The students taking all or part of the sequence had interests ranging from particle and nuclear theory through quantum optics to condensed matter physics experiment. The book does not cover as much ground as some texts. This is because I have tried to concentrate on the basic conceptual issues that many students find difficult. For a computation-method oriented course an instructor would probably wish to supplement this book with a more comprehensive and specialized text such as Peskin and Schroeder *An Introduction to Quantum Field Theory*, which is intended for particle theorists, or perhaps the venerable *Quantum Theory of Many-Particle Systems* by Fetter and Walecka. The most natural distribution of the material if the book is used for a two-semester course is as follows: 1st Semester: Chapters 1-11. 2nd semester: Chapters 12-18. The material in the first 11 chapters is covered using traditional quantum mechanics operator language. This is because the text is intended for people with a wide range of interests. Were I writing for particle-theory students only, I would start with path integrals from chapter one. For a broader readership, it seems useful to maintain continuity with traditional hamiltonian quantum mechanics for as long as one as there is no penalty in ease of comprehension — and this is the case with the simple field theories discussed in the earlier chapters.

内容概要

This book is intended to provide a general introduction to the physics of quantized fields and many-body physics. It is based on a two-semester sequence of courses taught at the University of Illinois at Urbana-Champaign at various times between 1985 and 1997. The students taking all or part of the sequence had interests ranging from particle and nuclear theory through quantum optics to condensed matter physics experiment. The book does not cover as much ground as some texts. This is because I have tried to concentrate on the basic conceptual issues that many students find difficult. For a computation-method oriented course an instructor would probably wish to supplement this book with a more comprehensive and specialized text such as Peskin and Schroeder An Introduction to Quantum Field Theory, which is intended for particle theorists, or perhaps the venerable Quantum Theory of Many-Particle Systems by Fetter and Walecka.

书籍目录

Preface
 1 Discrete Systems
 1.1 One-Dimensional Harmonic Crystal
 1.1.1 Normal Modes
 1.1.2 Harmonic Oscillator
 1.1.3 Annihilation and Creation Operators for Normal Modes
 1.2 Continuum Limit
 1.2.1 Sums and Integrals
 1.2.2 Continuum Fields
 2 Relativistic Scalar Fields
 2.1 Conventions
 2.2 The Klein-Gordon Equation
 2.2.1 Relativistic Normalization
 2.2.2 An Inner Product
 2.2.3 Complex Scalar Fields
 2.3 Symmetries and Noether's Theorem
 2.3.1 Internal Symmetries
 2.3.2 Space-Time Symmetries
 3 Perturbation Theory
 3.1 Interactions
 3.2 Perturbation Theory
 3.2.1 Interaction Picture
 3.2.2 Propagators and Time-Ordered Products
 3.3 Wick's Theorem
 3.3.1 Normal Products
 3.3.2 Wick's Theorem
 3.3.3 Applications
 4 Feynman Rules
 4.1 Diagrams
 4.1.1 Diagrams in Space-time
 4.1.2 Diagrams in Momentum Space
 4.2 Scattering Theory
 4.2.1 Cross-Sections
 4.2.2 Decay of an Unstable Particle
 5 Loops, Unitarity, and Analyticity
 5.1 Unitarity of the S Matrix
 5.2 The Analytic S Matrix
 5.2.1 Origin of Analyticity
 5.2.2 Unitarity and Branch Cuts
 5.2.3 Resonances, Widths, and Lifetimes
 5.3 Some Loop Diagrams
 5.3.1 Wick Rotation
 5.3.2 Feynman Parameters
 5.3.3 Dimensional Regularization
 6 Formal Developments
 6.1 Gell-Mann Low Theorem
 6.2 Lehmann-Källén Spectral Representation
 6.3 LSZ Reduction Formulae
 6.3.1 Amputation of External Legs
 6.3.2 In and Out States and Fields
 6.3.3 Borchers Classes
 7 Fermions
 7.1 Dirac Equation
 7.2 Spinors, Tensors, and Currents
 7.2.1 Field Bilinears
 7.2.2 Conservation Laws
 7.3 Holes and the Dirac Sea
 7.3.1 Positive and Negative Energies
 7.3.2 Holes
 7.4 Quantization
 7.4.1 Normal and Time-Ordered Products
 8 QED
 8.1 Quantizing Maxwell's Equations
 8.1.1 Hamiltonian Formalism
 8.1.2 Axial Gauge
 8.1.3 Lorentz Gauge
 8.2 Feynman Rules for QED
 8.2.1 Møller Scattering
 8.3 Ward Identity and Gauge Invariance
 8.3.1 The Ward Identity
 8.3.2 Applications
 9 Electrons in Solids
 9.1 Second Quantization
 9.2 Fermi Gas and Fermi Liquid
 9.2.1 One-Particle Density Matrix
 9.2.2 Linear Response
 9.2.3 Diagram Approach
 9.2.4 Applications
 9.3 Electrons and Phonons
 10 Nonrelativistic Bosons
 10.1 The Boson Field
 10.2 Spontaneous Symmetry Breaking
 10.3 Dilute Bose Gas
 10.3.1 Bogoliubov Transformation
 10.3.2 Field Equations
 10.3.3 Quantization
 10.3.4 Landau Criterion for Superfluidity
 10.3.5 Normal and Superfluid Densities
 10.4 Charged Boson
 10.4.1 Gross-Pitaevskii Equation
 10.4.2 Vortices
 10.4.3 Connection with Fluid Mechanics
 11 Finite Temperature
 11.1 Partition Functions
 11.2 Worldlines
 11.3 Matsubara Sums
 12 Path Integrals
 12.1 Quantum Mechanics of a Particle
 12.1.1 Real Time
 12.1.2 Euclidean Time
 12.2 Gauge Invariance and Operator Ordering
 12.3 Correlation Functions
 12.4 Fields
 12.5 Gaussian Integrals and Free Fields
 12.5.1 Real Fields
 12.5.2 Complex Fields
 12.6 Perturbation Theory
 13 Functional Methods
 13.1 Generating Functionals
 13.1.1 Effective Action
 13.2 Ward Identities
 13.2.1 Goldstone's Theorem
 14 Path Integrals for Fermions
 14.1 Berezin Integrals
 14.1.1 A Simple Supersymmetry
 14.2 Fermionic Coherent States
 14.3 Superconductors
 14.3.1 Effective Action
 15 Lattice Field Theory
 15.1 Boson Fields
 15.2 Random Walks
 15.3 Interactions and Bose Condensation
 15.3.1 Rotational Invariance
 15.4 Lattice Fermions
 15.4.1 No Chiral Lattice Fermions
 16 The Renormalization Group
 16.1 Transfer Matrices
 16.1.1 Continuum Limit
 16.1.2 Two-Dimensional Ising Model
 16.2 Block Spins and Renormalization Group
 16.2.1 Correlation Functions
 17 Fields and Renormalization
 17.1 The Free-Field Fixed Point
 17.2 The Gaussian Model
 17.3 General Method
 17.4 Nonlinear ϕ^4 Model
 17.4.1 Renormalizing
 17.4.2 Solution of the RGE
 17.5 Renormalizing
 18 Large N Expansions
 18.1 $O(N)$ Linear σ -Model
 18.2 Large N Expansions
 18.2.1 Linear vs. Nonlinear σ -Models
 A Relativistic State Normalization
 B The General Commutator
 C Dimensional Regularization
 C.1 Analytic Continuation and Integrals
 C.2 Propagators
 D Spinors and the Principle of the Sextant
 D.1 Constructing the γ -Matrices
 D.2 Basic Theorem
 D.3 Chirality
 D.4 $Spin(2N)$, $Pin(2N)$, and $SU(N)$
 E Indefinite Metric
 F Phonons and Momentum
 G Determinants in Quantum Mechanics
 Index
