

<<流体结构动力耦合作用>>

图书基本信息

书名：<<流体结构动力耦合作用>>

13位ISBN编号：9787507733181

10位ISBN编号：7507733181

出版时间：2010-1

出版时间：学苑出版社

作者：张永良

页数：223

## <<流体结构动力耦合作用>>

### 内容概要

The book aims to aid designers , researchers and postgraduate students of pipes conveying fluid in predicting their dynamic behaviour for various flow velocities , fluid pressures and initial tensions as well as varying geometric and material properties. It also aims to provide practically useful information of interactions between fluids and structures. Throughout , numerical results are carefully compared with experimental observations , and conclusions drawn as to the appropriateness and accuracy of the models used.

## 作者简介

ZHANG YongLiang is Professor of Hydropower Engineering in Tsinghua University and director of the Hydraulics Research Institute. Born in Zhejiang, he received a BSc (Engineering) and MSc degrees from Tsinghua University in 1987 and 1989, respectively, and PhD degree in fluid-structure interaction from Aberdeen University, United Kingdom in 2000. Zhang worked with consulting civil engineers in Philippines, Sri Lanka and China for seven years prior to starting PhD studies, and pursued PhD and Postdoc for six years in Aberdeen and London. He has been a member of the faculty at Tsinghua University since 2003. He has taught courses in Coastal and Offshore Engineering and Science, Computational Fluid Dynamics, Advanced Fluid Mechanics and has authored numerous technical papers and reports in several related fields. His research has often involved fluid mechanics, structural dynamics, wave theory, fluid-structure dynamic interaction and wave energy. He is a Vice president of Hydraulics Professional Committee of China Hydraulic Engineering Association.

## 书籍目录

List of Principal Symbols  
 Chapter 1 Introduction  
 1.1 Background  
 1.2 Objectives  
 1.3 Procedures  
 1.4 Outline of book  
 Chapter 2 Theoretical model I : elastic tubes conveying steady fluid flow  
 2.1 Introduction  
 2.2 Review of previous work  
 2.3 Basic assumptions and description  
 2.4 Finite element model development  
 2.4.1 Order of magnitude analysis  
 2.4.2 The dynamic equilibrium equation  
 2.5 Numerical solution  
 2.5.1 Dynamic response  
 2.5.2 Eigenvalues and eigenvectors  
 2.6 Analytical model  
 2.7 Numerical results  
 2.8 Conclusions  
 Chapter 3 Theoretical model H : elastic tubes conveying steady fluid flow  
 3.1 Introduction  
 3.2 Model formulation  
 3.3 A numerical example  
 3.4 Conclusions  
 Chapter 4 Theoretical model IH : viscoelastic tubes conveying steady fluid flow  
 4.1 Introduction  
 4.2 Finite element model of the system  
 4.2.1 The elastic finite element model  
 4.2.2 Viscoelastic material properties  
 4.2.3 Single-degree-of-freedom viscoelastic system  
 4.2.4 Multi-degree-of-freedom viscoelastic system  
 4.3 A numerical example  
 4.4 Conclusions  
 Chapter 5 Experimental model I : tubes conveying steady fluid flow  
 5.1 Introduction  
 5.2 Experimental set-up  
 5.2.1 Hydraulic piping system  
 5.2.2 Exciting system  
 5.2.3 Sensing system  
 5.2.4 Data acquisition and processing system  
 5.3 Experimental procedures and analysis  
 5.3.1 Experimental procedures  
 5.3.2 Experimental analysis  
 5.4 Experimental measurement range  
 5.5 Experimental uncertainty  
 5.6 Experimental results  
 5.7 Conclusions  
 Chapter 6 Comparison of experiment and theory : tubes conveying steady fluid flow  
 6.1 Introduction  
 6.2 Experimental and theoretical investigation  
 6.2.1 Experiment  
 6.2.2 Theory  
 6.3 Comparison of measured and predicted dynamic response  
 6.3.1 Effect of initial axial tensions  
 6.3.2 Effect of flow velocities  
 6.4 Comparison of measured and predicted natural frequencies  
 6.4.1 Effect of initial axial tensions  
 6.4.2 Effect of flow velocities  
 6.5 Conclusions  
 Chapter 7 Theoretical model IV : Thin cylindrical shells conveying steady inviscid fluid flow  
 7.1 Introduction  
 7.2 Overview of previous work  
 7.3 Governing equations  
 7.3.1 Shell equations  
 7.3.2 Fluid equations  
 7.4 The method of solution  
 7.5 Numerical examples  
 7.5.1 Convergence analysis  
 7.5.2 Model validation  
 7.5.3 Effect of initial axial tensions  
 7.5.4 Effect of hydrostatic pressures  
 7.5.5 Effect of the flow velocities  
 7.5.6 Effect of geometric properties  
 7.5.7 Effect of material properties  
 7.6 Conclusions  
 Chapter 8 Theoretical model V : thick cylindrical shells conveying steady inviscid fluid flow  
 8.1 Introduction  
 8.2 Overview of previous work  
 8.3 Formulation of the problem  
 8.3.1 The shell equation  
 8.3.2 The fluid equation  
 8.3.3 Boundary conditions  
 8.4 Method of solution  
 8.4.1 Shell domain  
 8.4.2 Fluid domain  
 8.4.3 Coupling equation  
 8.5 Results and discussion  
 8.5.1 Convergence analysis  
 8.5.2 Model validation  
 8.5.3 Effect of flow velocities  
 8.5.4 Effect of supported conditions  
 8.5.5 Effect of material properties  
 8.6 Conclusions  
 Chapter 9 Comparative study of axisymmetric thin cylindrical shells containing fluid  
 9.1 Introduction  
 9.2 Elemental mass and stiffness matrices  
 9.2.1 Cylindrical frustum elements  
 9.2.1.1 Frustum elements based on the Sanders shell theory  
 9.2.1.2 Frustum elements based on the combination of the Sanders shell theory and FEM  
 9.2.2 Isoparametric axisymmetrical shell elements  
 9.3 Free vibration of axisymmetrical shells containing fluid  
 9.4 Numerical examples  
 9.5 Conclusions  
 Chapter 10 Theoretical model VI : cylindrical shells conveying steady viscous fluid flow  
 10.1 Introduction  
 10.2 Overview of previous work  
 10.3 Governing equations  
 10.3.1 The Navier-Stokes equations  
 10.3.2 Shell equation  
 10.3.3 Boundary conditions  
 10.4 Finite element formulation  
 10.5 Fluid-structure coupling  
 10.6 Results and discussion  
 10.7 Conclusions  
 Chapter 11 Theoretical model VII : tubes conveying pulsatile viscous fluid flow  
 11.1 Introduction  
 11.2 Model formulation  
 11.3 Methods of solution  
 11.3.1 Numerical solution I  
 11.3.1.1 FDM  
 11.3.1.2 MOC  
 11.3.1.3 The combination of FDM and MOC  
 11.3.2 Numerical solution II  
 11.3.2.1 FEM  
 11.3.2.2 MOC  
 11.4 Numerical examples  
 11.4.1 Large wave speeds  
 11.4.2 Small wave speeds  
 11.5 Conclusions  
 11.5.1 Large wave speeds  
 11.5.2 Small wave speeds  
 Chapter 12 Experimental model II : tubes conveying pulsatile fluid flow  
 12.1 Introduction  
 12.2 Experimental set-up and procedures  
 12.2.1 Pulsatile flow system  
 12.2.2 Instrumentation  
 12.2.3 Experimental procedures  
 12.3 Experimental analysis  
 12.4 Comparisons of measured and predicted results  
 12.5 Conclusions  
 Chapter 13 Analysis of transient flow in pipelines with fluid-structure interaction  
 13.1 Introduction  
 13.2 Physical

<<流体结构动力耦合作用>>

model13.3 Method of solution13.4 Numerical results13.4.1 Validation13.4.2 Damping mechanisms13.4.3  
Effect of  $T_c$ 13.5 ConclusionsChapter 14 Transient flow in rapidly filling air-entrapped pipelines14.1  
Introduction14.2 Formulation of the problem14.2.1 Fluid domain14.2.2 Entrapped air domain14.3  
Coordinate transformation and scaling14.4 Method of solution14.5 Numerical results and discussion14.6  
ConclusionsChapter 15 Theoretical study on charging-up process in pipelines with entrapped air15.1  
Introduction15.2 Mathematical model15.3 Method of solution15.4 Numerical results15.5  
ConclusionsReferencesAppendix 1 Characteristic equations and the Bessel functionAppendix 2  
Isoparametric elements
