<<中国传统医药>>

内容概要

In ancient Chinese civilization, astronomy, mathematics, agriculture and medicine were the four advanced sciences. Among them, medicine is the only one that has never been replaced by Western science and still plays an important role in protecting the health of Chinese people. How traditional Chinese medicine, a classic system of medicine without any connection with modern science, can still exist in spite of the fact that modern medicine can basically meet the need of healthcare?

Is traditional Chinese medicine a science or just a collection of experience?

Does it still have the possibility and space to further develop itself along its own orbit? Is there any possibility that it may be replaced by modern medicine?

章节摘录

Since it was established at a time without the support of advanced science, how can TCM survive in todays society when modern health care is almost able to cover all the medical needs?

Is TCM a science or cumulative experiences?

Is it able to go further along its own path of development, or is it meant to be replaced by mainstream Western medicine? Questions like these concern many people. In most peoples eyes, TCM is a medicinal system that dates back several thousand years, and its theories, experiences and techniques Western medicine is spreading across the country, its new system, which is greatly contradictory to that of TCM, takes turns to dominate the academy. It was known as a "revolution" in Chinese medical community. If fact, if we pay close attention, we will find a revolution in the history of TCM itself. After many big and small revolutions, todays Chinese medicine has become "contemporary TCM," which greatly differs from TCM in ancient times. So sharing a same region does not exclude changes.
