<<磁动力学导论>>

内容概要

magnetic fields influence many natural and man-made flows. they are routinely used in industry to heat, pump, stir and levitate liquid metals. there is the terrestrial magnetic field which is maintained by fluid motion in the earth's core, the solar magnetic field which generates sunspots and solar flares, and the galactic field which influences the formation of stars. this is an introductory text on magnetohydrodynamics (mhd) - the study of the interaction of magnetic fields and conducting fluids.

this book is intended to serve as an introductory text for advanced undergraduate and postgraduate students in physics, applied mathematics and engineering. the material in the text is heavily weighted towards incompressible flows and to terrestrial (as distinct from astrophysical) applications. the final sections of the text also contain an outline of the latest advances in the metallurgical applications of mhd and so are relevant to professional researchers in applied mathematics, engineering and metallurgy.

书籍目录

preface

part a: the fundamentals of mhd

introduction: the aims of part a

1 a qualitative overview of mhd

1.1 what is mhd?

1.2 a brief history of mhd

1.3 from electrodynamics to mhd: a simple experiment

1.3.1 some important parameters in electrodynamics and mhd

1.3.2 a brief reminder of the laws of electrodynamics

1.3.3 a familiar high-school experiment

1.3.4 a summary of the key results for mhd

1.4 some simple applications of mhd

2 the governing equations of electrodynamics

2.1 the electric field and the lorentz force

2.2 ohm's law and the volumetric lorentz force

2.3 ampere's law

2.4 faraday's law in differential form

2.5 the reduced form of maxwell's equations for mhd

2.6 a transport equation for \mathbf{b}

2.7 on the remarkable nature of faraday and of faraday's

law

2.7.1 an historical footnote

2.7.2 an important kinematic equation

2.7.3 the full significance of faraday's law

2.7.4 faraday's law in ideal conductors: alfvén's theorem

3 the governing equations of fluid mechanics

part 1: fluid flow in the absence of lorentz forces

3.1 elementary concepts

3.1.1 different categories of fluid flow

3.1.2 the navier-stokes equation

3.2 vorticity, angular momentum and the biot-savart law

3.3 advection and diffusion of vorticity

3.3.1 the vorticity equation

3.3.2 advection and diffusion of vorticity: temperature as a

prototype

3.3.3 vortex line stretching

3.4 kelvin's theorem, helmholtz's laws and helicity

3.4.1 kelvin's theorem and helmholtz's laws

3.4.2 helicity

3.5 the prandtl-batchelor theorem

3.6 boundary layers, reynolds stresses and turbulence

models

3.6.1 boundary layers

3.6.2 reynolds stresses and turbulence models

3.7 ekman pumping in rotating flows

<<磁动力学导论>>

part 2: incorporating the lorentz force

3.8 the full equations of mhd and key dimensionless groups

3.9 maxwell stresses

4 kinematics of mhd: advection and diffusion of a magnetic field

5 dynamics at low magnetic reynolds numbers

6 dynamics at moderate to high magnetic reynolds' number

7 mhd turbulence at low and high magnetic reynolds number

Part b: applications in engineering and metallurgy

8 introduction: an overview of metallurgical applications

9 magnetic damping using static fields

10 axisymmetric flows driven by the injection of current

11 mhd instabilities in reduction cells

12 high-frequency fields: magnetic levitation and induction

heating

appendices

bibliography

subject index

章节摘录

版权页：插图：are usually fairly straightforward. It pays, therefore, when confronted with a welter of mathematical detail, to follow the advice of Kelvin and keep asking the question: 'What is really going on?'

In line with this principle, we start, in 1.3, not with fully fledged MHD, but rather with a simple laboratory experiment. This consists of a static magnetic field at right angles to a conducting rod which in turn slides along two conducting rails. Such an apparatus is commonly used in high schools to illustrate Faraday's law of induction. However, when the dynamics of the sliding rod are investigated we discover a lot more than just Faraday's law. In fact, this simple experiment illustrates many of the key physical phenomena to be found in MHD. That is to say, a magnetic field, B , and a moving, conducting medium interact in such a way as to restrain the relative motion of the field and medium. We start our formal analysis in Chapters 2 and 3, where we set out the governing equations of MHD. These consist of the Navier-Stokes equation and a simplified version of Maxwell's equations from which Gauss's law is omitted and displacement currents are neglected. In Chapter 4 we consider one half of the coupling between B and the medium. Specifically, we look at the influence of a prescribed fluid velocity, u , on the magnetic field without worrying about the origin of the velocity field or the backreaction of the Lorentz force on the fluid. In effect, we take u to be prescribed, dispense with the Navier-Stokes equation, and focus on the role of u when using Maxwell's equations. We finally introduce dynamics in Chapters 5 and 6. We start, in Chapter 5, by considering weakly conducting or slowly moving fluids in which the magnetic field greatly influences the motion of the conductor but there is little back-reaction on the imposed magnetic field. This typifies much of liquid-metal MHD. Next, in Chapter 6, we consider highly conducting, or rapidly moving, fluids in which the two-way coupling of B and u is strong. Here interest focuses on stability theory, which is important in plasma containment, and on dynamo theory, a phenomenon which is of considerable importance in geophysics. We end, in Chapter 7, with a discussion of MHD turbulence.
