

<<量子化学>>

图书基本信息

书名：<<量子化学>>

13位ISBN编号：9787510035074

10位ISBN编号：7510035074

出版时间：2011-6

出版时间：世界图书出版公司

作者：（美）洛韦 著

页数：703

版权说明：本站所提供下载的PDF图书仅提供预览和简介，请支持正版图书。

<<量子化学>>

内容概要

《量子化学(第3版)》在写作风格上是第二版的延续，内容上进行了扩充，更新，讲解上更加详细。

结合数学最新进展，在概念上达到清晰易懂。

和同类型的书相比，这本书的最大优点是概念讲述地十分透彻，让读者重新认识各种计算方法的重要性。

每章末都有习题，是学习量子化学研究生水平入门书籍，也很适合该专业的老师作为参考书。

目次：经典波和时间独立schrödinger波方程；一些简单系统的量子力学；谐振子；类离子，角动量和刚量转动；多电子原子；量子力学定理和假设；变分法；简单hückel方法和应用；线性变分法的矩阵公式；扩展hückel方法；scf-lcao-mo方法和扩展；时间独立rayleigh-schrödinger扰动法；群论；定性分子轨道理论；周期系统的分子轨道。

读者对象：物理、化学以及这两专业交叉学科的研究生，教师和科研人员。

<<量子化学>>

作者简介

作者：(美国)洛韦 (John P.Lowe) Kirk A.Peterson

书籍目录

preface to the third edition
preface to the second edition
preface to the first edition
1classical waves and the time-independent schrodinger wave equation
1-1introduction
1-2waves
1-3the classical wave equation
1-4standing waves in a clamped string
1-5light as an electromagnetic wave
1-6the photoelectric effect
1-7the wave nature of matter
1-8a diffraction experiment with electrons
1-9schrodinger's time-independent wave equation
1-10conditions on
1-11some insight into the schrodinger equation
1-12summary
problems
multiple choice questions
reference
2quantum mechanics of some simple systems
2-1the particle in a one-dimensional "box".
2-2detailed examination of particle-in-a-box solutions
2-3the particle in a one-dimensional "box" with one finite wall
2-4the particle in an infinite "box" with a finite central barrier
2-5the free particle in one dimension
2-6the particle in a ring of constant potential
2-7the particle in a three-dimensional box: separation of variables
2-8the scattering of particles in one dimension
2-9summary
problems
multiple choice questions
references
3the one-dimensional harmonic oscillator
3-1introduction
2-2some characteristics of the classical one-dimensional harmonic oscillator
3-3the quantum-mechanical harmonic oscillator
3-4solution of the harmonic oscillator schrdinger equation
3-5quantum-mechanical average value of the potential energy

<<量子化学>>

3-6 vibrations of diatomic molecules

3-7 summary

problems

multiple choice questions

the hydrogenlike ion, angular momentum, and the rigid rotor

4-1 the schrodinger equation and the nature of its solutions

4-2 separation of variables

4-3 solution of the and equations

4-4 atomic units

4-5 angular momentum and spherical harmonics

4-6 angular momentum and magnetic moment

4-7 angular momentum in molecular rotation--the rigid rotor

4-8 summary

problems

multiple choice questions

references

5 many-electron atoms

5-1 the independent electron approximation

5-2 simple products and electron exchange symmetry

5-3 electron spin and the exclusion principle

5-4 slater determinants and the pauli principle

5-5 singlet and triplet states for the $1s2s$ configuration of helium

5-6 the self-consistent field, slater-type orbitals, and the aufbau

principle

5-7 electron angular momentum in atoms

5-8 overview

problems

multiple choice questions

references

6 postulates and theorems of quantum mechanics

6-1 introduction

6-2 the wavefunction postulate

6-3 the postulate for constructing operators

6-4 the time-dependent schrodinger equation postulate

6-5 the postulate relating measured values to eigenvalues

6-6 the postulate for average values

6-7 hermitian operators

6-8 proof that eigenvalues of hermitian operators are real

6-9 proof that nondegenerate eigenfunctions of a hermitian operator

form an orthogonal set

<<量子化学>>

6-10 demonstration that all eigenfunctions of a hermitian operator may be expressed as an orthonormal set

6-11 proof that commuting operators have simultaneous eigenfunctions

6-12 completeness of eigenfunctions of a hermitian operator

6-13 the variation principle

6-14 the pauli exclusion principle

6-15 measurement, commutators, and uncertainty

6-16 time-dependent states

6-17 summary

problems

multiple choice questions

references

7 the variation method

7-1 the spirit of the method

7-2 nonlinear variation: the hydrogen atom

7-3 nonlinear variation: the helium atom

7-4 linear variation: the polarizability of the hydrogen atom

7-5 linear combination of atomic orbitals: the he molecule-ion

7-6 molecular orbitals of homonuclear diatomic molecules

7-7 basis set choice and the variational wavefunction

7-8 beyond the orbital approximation

problems

multiple choice questions

references

8 the simple hückel method and applications

8-1 the importance of symmetry

8-2 the assumption of orbital separability

8-3 the independent electron assumption

8-4 setting up the hückel determinant

8-5 solving the hückel determinant equation for orbital energies

8-6 solving for the molecular orbitals

8-7 the cyclopropenyl system: handling degeneracies

8-8 charge distributions from hmos

8-9 some simplifying generalizations

8-10 hmo calculations on some simple molecules

8-11 summary: the simple hmo method for hydrocarbons

8-12 relation between bond order and bond length

8-13 π -electron densities and electron spin resonance

hyperfine splitting constants

8-14 orbital energies and oxidation-reduction potentials

<<量子化学>>

8-15orbital energies and ionization energies
 8-16 π -electron energy and aromaticity
 8-17extension to heteroatomic molecules
 8-18self-consistent variations of α and β
 8-19hmo reaction indices
 8-20conclusions
 problems
 multiple choice questions
 references
 matrix formulation of the linear variation method
 9-1introduction
 9-2matrices and vectors
 9-3matrix formulation of the linear variation method
 9-4solving the matrix equation
 9-5summary
 problems
 references
 10 the extended hückel method
 10-1the extended hückel method
 10-2mulliken populations
 10-3extended hückel energies and mulliken populations
 10-4extended hückel energies and experimental
 energies
 problems
 references
 11 the scf-lcao-mo method and extensions
 11-1ab initio calculations
 11-2the molecular hamiltonian
 11-3the form of the wavefunction
 11-4the nature of the basis set
 11-5the lcao-mo-scf equation
 11-6interpretation of the lcao-mo-scf eigenvalues
 11-7the scf total electronic energy
 11-8basis sets
 11-9the hartree-fock limit
 11-10correlation energy
 11-11koopmans' theorem
 11-12configuration interaction
 11-13size consistency and the m011er-plesset and coupled
 cluster
 treatments of correlation
 11-14multideterminant methods
 11-15density functional theory methods
 11-16examples of ab initio calculations
 11-17approximate scf-mo methods
 problems
 references

<<量子化学>>

12 time-independent rayleigh-schrödinger perturbation theory

12-1an introductory example

12-2formal development of the theory for nondegenerate states..

12-3a uniform electrostatic perturbation of an electron in a "wire"

12-4the ground-state energy to first-order of heliumlike systems

12-5perturbation at an atom in the simple hückel method

12-6perturbation theory for a degenerate state

12-7polarizability of the hydrogen atom in the $n = 2$ states

12-8degenerate-level perturbation theory by inspection

12-9interaction between two orbitals: an important chemical model

12-10connection between time-independent perturbation theory and spectroscopic selection rules

problems

multiple choice questions

references

13 group theory

13-1introduction

13-2an elementary example

13-3symmetry point groups

13-4the concept of class

13-5symmetry elements and their notation

13-6identifying the point group of a molecule

13-7representations for groups

13-8generating representations from basis functions

13-9labels for representations

13-10some connections between the representation table and molecular orbitals

13-11representations for cyclic and related groups

13-12orthogonality in irreducible inequivalent representations

13-13characters and character tables

13-14using characters to resolve reducible representations

13-15identifying molecular orbital symmetries

13-16determining in which molecular orbital an atomic orbital will appear

13-17generating symmetry orbitals

13-18hybrid orbitals and localized orbitals

13-19symmetry and integration

problems

<<量子化学>>

multiple choice questions
 references
 14 qualitative molecular orbital theory
 14-1 the need for a qualitative theory
 14-2 hierarchy in molecular structure and in molecular orbitals
 14-3 h^+ revisited
 14-4 h^2 : comparisons with $h+2$
 14-5 rules for qualitative molecular orbital theory
 14-6 application of qmot rules to homonuclear diatomic molecules
 14-7 shapes of polyatomic molecules: walsh diagrams
 14-8 frontier orbitals
 14-9 qualitative molecular orbital theory of reactions
 problems
 references
 15 molecular orbital theory of periodic systems
 15-1 introduction
 15-2 the free particle in one dimension
 15-3 the particle in a ring
 15-4 benzene
 15-5 general form of one-electron orbitals in periodic potentials--bloch's theorem
 15-6a retrospective pause
 15-7 an example: polyacetylene with uniform bond lengths
 15-8 electrical conductivity
 15-9 polyacetylene with alternating bond lengths--peierls' distortion
 15-10 electronic structure of all-trans polyacetylene
 15-11 comparison of ehmo and scf results on polyacetylene
 15-12 effects of chemical substitution on the bands
 15-13 poly-paraphenylene--a ring polymer
 15-14 energy calculations
 15-15 two-dimensional periodicity and vectors in reciprocal space
 15-16 periodicity in three dimensions--graphite
 15-17 summary
 problems
 references
 appendix 1 useful integrals
 appendix 2 determinants
 appendix 3 evaluation of the coulomb repulsion integral over is aos
 appendix 4 angular momentum rules
 appendix 5 the pairing theorem

<<量子化学>>

appendix 6 hückel molecular orbital energies, coefficients,
electron densities, and bond orders for some simple molecules

appendix 7 derivation of the hartree-fock equation

appendix 8 the virial theorem for atoms and diatomic
molecules

contents

appendix 9 bra-ket notation

appendix 10 values of some useful constants and conversion
factor,

appendix 11 group theoretical charts and tables

appendix 12 hints for solving selected problems

appendix 13 answers to problems
