前言

The study of pathology, a science so basic to clinical medicine, has been abbreviated sadly in many medical schools in recent years, and that too at a time when explosive growth is occurring in the science. Recent advances in immunopathology, diagnosis of bacterial and viral diseases including AIDS, and detection of infectious agents such as papillomavirus in cervical dysplasia are proceeding at a tremendous rate. The thirteenth edition of Pathology: PreTest™ Self-Assessment and Review includes such new subject areas as predictive values in the interpretation of laboratory data, the importance of cytokines, the molecular basis of genetic and other disease processes, and molecular biology techniques as these apply to lymphoproliferative disorders and other tumors. The medical student must feel submerged at times in the flood of information——occasionally instructors may have similar feelings. This edition is not intended to cover all new knowledge in addition to including older anatomic and Clinical pathology. It is, rather, a serious attempt to present important facts about many disease processes in the hope that the student will read much further in major textbooks and journals and will receive some assistance in passing medical school, licensure, or board examinations.

内容概要

This book is a wonderful resource for second year medical students taking pathology as well as medical students in their clinical years. It is a good review and highly relevant to what I am seeing in the hospital.

章节摘录

插图：Chancroid is an acute venereal disease that is characterized by painful genital ulcers with lymphadenopathy. It is caused by *H. ducreyi*, a small, gram-negative bacillus. Gram stains of the suppurative lesions or cultures on specialized media may be used to make the diagnosis. Serologic tests are not useful. *Neisseria gonorrhoeae*, a gram-negative diplococcus, causes gonorrhea, an acute suppurative infection of the genital tract. In males it produces a purulent discharge (urethritis) and dysuria. In women, it may be asymptomatic (50%), or it may produce infection of the cervix with accompanying vaginal discharge, dysuria, and abdominal pain. Ascending infections in women can lead to salpingitis, tuboovarian abscess, and pelvic inflammatory disease (PID). Fitz-Hugh-Curtis syndrome refers to perihepatitis infection. In newborns, infection acquired during birth can produce a purulent conjunctivitis (ophthalmia neonatorum). This disease has been prevented due to prophylactic therapy to newborn infants. A Gram stain of the urethral or cervical exudate may reveal the intracytoplasmic gram-negative diplococci, or the exudate can be cultured on special media.
